ABSTRACT OF RESEARCH PAPER

As we have done a detailed review/seminar on the base topic Dmitry is a KALI LINUX tool . The purpose of these tools is to help attackers identify information about a target, to assist with locating potential attack vectors that may work on the system. This information can be really valuable for social engineering attacks, as it provides the attacker with potential points of contact. It can also help the attacker seem more credible if they are able to give information about the web page or domain that the owner is using.

On advance research we would be comparing on Dmitry with other information gathering tools in Kali Linux like Nmap tool,ZenMap,whois lookup,SPARTA

The comparisons can be made based on the different ability of the tools.Each tool has its own specific advantage. Like for example in case of Nmap ,this tool is mainly used to discover hosts , ports, and services along with their versions over a network and for whois lookup this tool mainly focus on checking the availability of domain names and track down the registrants of the fraud domain.
